308-4290, CP3/4-3D62

Voluntary Results Feedback Form

- I am an examiner in Workgroup: Example: 1713
- Relevant prior art **found**, search results used as follows:

- ☐ 102 rejection
- ☐ 103 rejection
- ☐ Cited as being of interest.
- ☐ Helped examiner better understand the invention.
- ☐ Helped examiner better understand the state of the art in their technology.

Types of relevant prior art found:

- ☐ Foreign Patent(s)
- ☐ Non-Patent Literature
(journal articles, conference proceedings, new product announcements etc.)

- Relevant prior art **not found**:

- ☐ Results verified the lack of relevant prior art (helped determine patentability).
- ☐ Results were not useful in determining patentability or understanding the invention.

Comments:

Drop off or send completed forms to STIC/EIC1700 CP3/4 3D62

SEARCH REQUEST FORM

Scientific and Technical Information Center

Requester's Full Name: SOW-FUN HUN Examiner #: 77463 Date: 09/16/03
 Art Unit: 1772 Phone Number 308-3265 Serial Number: 10/075,362
 Mail Box and Bldg/Room Location: CB 11A11 Results Format Preferred (circle): PAPER DISK E-MAIL

If more than one search is submitted, please prioritize searches in order of need.

Please provide a detailed statement of the search topic, and describe as specifically as possible the subject matter to be searched. Include the elected species or structures, keywords, synonyms, acronyms, and registry numbers, and combine with the concept or utility of the invention. Define any terms that may have a special meaning. Give examples or relevant citations, authors, etc, if known. Please attach a copy of the cover sheet, pertinent claims, and abstract.

Title of Invention: CELLULOSE ESTER FILM, ITS MANUFACTURING, . . . ETC
 Inventors (please provide full names): KUNIO SHIMIZU, TAKASHI MURAKAMI

Earliest Priority Filing Date: 03/01/2001

For Sequence Searches Only Please include all pertinent information (parent, child, divisional, or issued patent numbers) along with the appropriate serial number.

- ① PLEASE SEARCH FORMULA (1)
 ② CROSS WITH CELLULOSE (ESTER, ACETATE, ACYL, DIACETATE, TRIACETATE)
 IF TOO MANY.
 THANK YOU.

AB Title method for prepg. a dope by dissolving a polymer in a solvent comprises (A) roughly dissolving the polymer in the solvent; and (B) promoting the dissoln. by supplying the soln. roughly dissolved in the step (A) so as to prep. the dope. Thus, a **film** produced from the dope using the above procedure shows retardation of 40 nm, little optical anisotropy, and excellent optical performances.

AB The optically anisotropic drawn films showing good viewing angle
 and uniform color, useful for $\lambda/4$ plates, have retardation
 satisfying $0.60 < Re(450)/Re(550) < 0.97$ and $1.01 < Re(650)/Re(550) < 1.35$
 [$Re(450)$, $Re(550)$, $Re(650)$ = in-plane retardation values at wavelengths
 450, 550, and 650 nm, resp.], and variations in $Re(550)$ in width and
 longitudinal directions, and variations in thicknesses in the width and
 longitudinal directions are all $\leq 10\%$. Preferably, the
 films at least contain 0.5-15% retardation improvers bearing 2
 arom. rings. Preferably, the films comprise cellulose
 acetate with acetylation degree 2.4-2.9. The process employs 2 pairs of
 nip rolls disposed with a spun of 2-8-folds of film width before
 drawing, and drawing is run while controlling the temp. of the edges
 5-50.degree. higher than that of the center. The retarders satisfy the
 conditions given for the drawn films and also $100 < Re(550) < 160$
 (nm). The circularly polarizing plate for the LCD comprises the retarder

and a **film** polarizer laminated in such a way that the in plane slow axis of the retarder is on a 45.degree. angle with the polarizing axis of the polarizer.

AB **Cellulose ester film** with thickness of 10 - 60 .mu.m
 and moisture vapor transmittance of 20 - 200 g/m2.24 h is obtained by
 casting soln., which is composed of 1 - 30 wt. % of compd. I, wherein Y is

an ester bond or a divalent org. group contg. an ester bond, Ra and Rb independently represent a substituent, and m, n = 0 - 5, and Ras or Rbs may be the same or different if m, n .gtoreq. 2, UV absorbent, silicon oxide and Me acetate, on a support to form a web, drying for 30 - 90 s., peeling from the support, and further drying; the prepd. **cellulose ester film** can be used as a polarizing plate for **liq. crystal** display. Thus, mixt. of compds. presented by I, UV absorbents, particles Aerostl 200V, acetyl **cellulose** with an acetyl substitution degree of 2.7, were dissolved in methylene chloride and ethanol solns. to form the **cellulose ester soln.**, which was then cooled to casting on stainless steel, heated, blown, dried and peeled from the substrate to obtain the **cellulose ester film** after further drying and stretching for 1.05 times in the transverse direction; the **cellulose ester film** was treated with sodium hydroxide soln., and then laminated onto a polarized polyvinyl alc. **film**, pressurized and dried to obtain a polarizing plates, which were superposed on both sides of a com. **liq. crystal** cell in certain directions to prep. a **liq. crystal** panel, followed by installing in a color **liq. crystal** display.

AB The agents are used to enhance the increase of refractive index in the direction which is in a right angle to the stretch direction of a monoaxially stretched **cellulose ester film**, and are of QmLMn compds. (Q = alignment providing groups; M = refractive index providing groups; L = direct bond or linking groups; m, n .gtoreq.1). By using the agents, high refractive index value can be reasonably attained without the needs for high **film** stretching. Thus, casting a mixt. of **cellulose** acetate (av. acetylation degree 60.9%) 120, 9,9-bis(3'-ethyl-4-octoxyphenyl)fluorene (control agent) 2.4, tri-Ph phosphate 9.36, biphenyl di-Ph phosphate 4.68, CH2Cl2 718 and MeOH 62.4 parts on a glass surface, drying at room temp. for 1 min and at 45.degree. for 5 min, detaching the resulting **film**, heating at 100.degree. for 30 min and at 130.degree. for 20 min, cutting into dimension, stretching the **film** 1.33:1 in its casting direction at 130.degree. and cooling gave a **film** with thickness 102 .mu.m, and retardation values (Re) 66.2, 30.3 and 18.2 nm at wavelength of 450m 550 and 590 nm, resp.

AB The retarder as a polymer **film** contains rodlike compds. having max. UV absorption of their soln. at wavelength .ltoreq.250 nm and satisfies (1) retardation at wavelength 450 nm (Re450) 60-135 nm; retardation at 590 nm (Re590) 100-170 nm; and Re590 - Re450 .gtoreq.2 nm or (2) Re450 120-270 nm; Re590 200-340 nm; and Re590 - Re450 .gtoreq.2 nm. The circular polarizer as a laminate of the above retarder satisfying (1) and a polarizing **film** to form the angle between the slow axis in the retarder and the polarizing axis of the polarizing **film** 45.degree.. The display has a liq. crystal cell, the above circular polarizer, and a reflector so that the polymer **film** side is placed at the liq. crystal cell side. The retarder has good durability and introduces .lambda./4 or .lambda./2 phase difference in wide wavelength region.

AB Cellulose acetate butyrate and cellulose acetate propionate (I) were formulated with solid plasticizers and impact modifiers in order to achieve superior combinations of stiffness and impact strength. The exptl. work could not be extended to cellulose acetate because of its incompatibility with solid plasticizers. The solid plasticizers evaluated included: glycerol tribenzoate, sucrose benzoate, neopentyl glycol dibenzoate, 1,4-cyclohexane dimethanol dibenzoate, o,p-toluenesulfonamide, and dicyclohexyl phthalate. The useful plasticizers had 2 general characteristics, i.e., (1) compatibility with the cellulose ester from 5 to 25 wt.% and (2) solids at room temp. The 2 impact modifiers were core-shell impact modifiers having the trade names Paraloid KM-323-B and Paraloid KM-334. They were tested at levels .ltoreq.5 wt.%, but they could probably be used at levels .ltoreq.10 wt.%. The flexural moduli ranged from 1800 to 2400 MPa, as compared to 1300 to 1800 MPa for I formulated with liq. plasticizer. The formulation of I and solid plasticizer contg. the impact modifiers had notched Izod impact strength at 23.degree. of 140 to 200 J/M, whereas without impact modifiers, it was 50 to 80 J/M.

 AB Controlled released compns. are disclosed, comprising complexes for
 treating aquatic organism(s) in a column of water. The complexes comprise
 bioactive agent(s), a carrier and **coating** component(s) for
 regulating the controlled release rate and release profile of the
 bioactive agent in water. One bioactive agent and one joint-function
 component can serve as both a carrier and **coating** to regulate
 the controlled release rate and release profile of the bioactive agent in
 water, with or without optional binder components and/or addnl.
 formulation materials. The components are selected to sink or float so
 that the complexes will permeate and/or remain in any planar or volumetric
 segment of a water column for a period of time that is sufficient to treat
 a population of aquatic organisms. Methods for treating a column of water
 are also disclosed which comprise delivering the compns. to a column of
 water or to a dry preflood area (pretreatment) that will develop in a
 column of water or a flood area. The compn. and process can also be used
 to treat terrestrial organisms. Suitable bioactive agents are *Bacillus*
thuringiensis israelensis, *B. sphaericus*, *Lagenidium giganteum*,
 methoprene, diflubenzuron, pyriproxyfen, temephos, chlorpyrifos,
 pirimiphos-Me, .lambda.-cyhalothrin, etc. The carriers comprise silica,
cellulose fiber, metal oxides, etc. The **coatings** with a
 sp.gr. >1 comprise tri-Et citrate, acetyltriethyl citrate, tri-Bu citrate,
 acetyltributyl citrate, acetyltriethyl citrate, trihexyl trimellitate,
 dicyclohexyl phthalate, di-Et phthalate, etc. **Coatings** with sp.
 gr. <1 comprise butyryl trihexyl citrate, monostearyl citrate, stearyl
 alc., myristyl alc., octadecanoic acid, glyceryl stearate and waxes.

 AB The layers of polymers deposited onto the cellulose hydrate **films**
 were investigated by the methods of IR ellipsometry and attenuated total
 reflection. Based on the reflection coeffs. in approxn. of the 3-layer
 model, the absorption and refractive indexes of the layers and
films in spectral regions of 10.6 .mu.m have been calcd. and
 discussed.

PRAI	DE 1987-3710292		19870328		

AB Water-resistant sunscreens contain a UV absorber 1-30, H2O 15-95, an ethylcellulose polymer 0.1-6.0, a surfactant 0.01-12, and an alk. dispersant 0.03-5% by wt. These film-forming formulations are applied to the skin as aq. lotions or creams, with the aid of a polymeric binder. Ethylcellulose dispersions used here are com. available as XD-30543-40, XD-30543-30, and Ethogel, and can be mixed with suitable sunscreen agents. The addn. of water-insol. softening agents furthermore prevents loss of moisture from the skin, gives a smooth, soft feeling on the skin, and prevents tackiness of the formulation. A preferred alk. dispersing agent is NH4OH. A dispersion contg. padimate O 4.00, ethylcellulose 1.0, 28% NH4OH 0.40, myristic acid 0.40, and H2O 4.20 was mixed with a dispersion contg. Carbopol-940 0.25, EtOH 12.00, padimate O 4.00, ethylhexyl p-methoxycinnamate 4.00, water 69.70, and 28% aq. NH4OH 0.05% by wt. to give a sunscreen cream.

 CC 36 (Plastics Manufacture and Processing)
 AB Labeling of plastic **film** and heat sealing with heat-activatable papers are described. The compn. of the material, smoothness of the surface, and its contamination affect the adhesive strength when labeling different surfaces. Observations and tests in the lab. and in practice are described. Hot-adhesive paper is paper having a **coating** of a heat-activatable material, which becomes sticky and suitable for sealing on heating. The **coatings** consist of poly(vinyl chloride) [9002-86-2], polyacrylates, poly(vinyl acetate) [9003-20-7], and other thermoplastics. Dicyclohexyl phthalate [84-61-7] or diphenyl phthalate [84-62-8] are suitable plasticizers. Sealing to wool, cotton, and linen is rather poor because the surface is too rough. Sealing to paper, boxboard, and parchment is very good if the surfaces have a certain amount of roughness. This is also true of cellophane, soft PVC, polystyrene [9003-53-6], **cellulose** triacetate [9012-09-3], and polypropylene [9003-07-0]. Sealing to saran, polyester, hard PVC, and rubber hydrochloride is moderately effective. Adhesion to untreated polyethylene [9002-88-4] and polyamides is poor. Interlaminar strength for bonding to various materials is shown graphically and values initially and after 2, 4, and 6 weeks are given. Wetting angles with water and with Palatinol C (a phthalic acid ester) are also given. Dusting of cellophane-saran **films** with calcium carbonate [471-34-1], starch [9005-25-8], or poly(vinyl alc.) [9002-89-5] reduced adhesion of the **film** to heat-activatable paper greatly, as is shown graphically. The paper is especially useful for labeling ampuls.

AB The wettability of films with heat-sealable coatings with water-contg. liq. adhesives is improved by adding waxes of OH no. 150-400 to the coating s. A regenerated cellulose film of wt. 30 g/m2 and contg. glycerol 15, water 9, and a cationic melamine-HCHO resin 0.3% was coated on both sides with a compn. contg. nitrocellulose 48, di-Bu phthalate 17, dicyclohexyl phthalate 17, ethylene glycol ester of a terpene-maleic acid adduct 10, a glycerol ester of polymd. rosin (Polypale Ester 10) 5, maleic acid 2, bentonite 0.5, and 12-hydroxystearyl alc. 2 g

as an 18% solids soln. in 11:9 EtOAc-toluene and dried, giving a coating which was easily wetted by aq. adhesives and printing ink solvents. The film had a permeability value of 6000 g water/hr/100 m² at 39.degree. and 100% relative humidity. Films sandwiched together with a 50% poly(vinyl acetate) emulsion adhesive had bond strength of 235 g after 5 min and 590 g after 1 day. Glycerol tris(12-hydroxystearate) and glycerol 12-hydroxystearate were also used as hydroxylated waxes.

AB	Plasticizer esters have the general formula, ROOCC ₆ H ₄ COOR', in which OOCC ₆ H ₄ COO is the isophthalic acid (I) or terephthalic acid radical, and R and R' are cyclohexyl radicals or cyclohexyl radicals mono-substituted by an alkyl group. The preferred esters are dicyclohexyl isophthalate (II), bis(4-methylcyclohexyl) isophthalate, dicyclohexyl terephthalate and bis(4-methylcyclohexyl) terephthalate. The esters are particularly suitable for imparting heat-sealing and H ₂ O-vapor impermeability properties to nitrocellulose films. Thus, I 83, cyclohexanol 235, p-toluenesulfonic acid 2.5, and toluene 130 g. were refluxed, and the H ₂ O of esterification was sepd. at 125-35.degree. for 20 hrs.; 17.8 ml. H ₂ O sepd. The recovered pure product was 156 g. II with a m.p. of 33.degree. (yield 94.7%).
